TenCate develops and produces materials that deliver increased performance, reduce costs and measurable results to provide advanced solutions utilizing patent pending Mirafi® RSi geosynthetics that make a difference.

The Difference Mirafi® RSi-Series Woven Integrated* Geosynthetics Make:

  **Superior integration**.
- **Reinforcement Strength.** Higher tensile modulus properties than the leading stabilization products.
- **Separation and Filtration.** Unique double layer construction provides a wide range of pore sizes for an excellent separation factor, superior filtration and flow characteristics of a fine to coarse sand layer.
- **Soil and Base Course Interaction.** Excellent soil and base course confinement resulting in greater load distribution.
- **Durability.** Robust damage resistance for moderate to severe stress installations.
- **Roll Sizes.** Mirafi® RSi-Series geosynthetics come in several roll sizes to fit project requirements.
- **Seams.** Panels can be seamed in the factory or field, providing cross-roll direction strength to facilitate efficient installation.

**APPLICATIONS**
When superior performance, flexibility and versatility are necessary, Mirafi® RSi-Series geosynthetics make the difference for varying application needs including: base course reinforcement and subgrade stabilization for road, runway and railway construction; embankment stabilization on soft foundations; reinforcement for mechanically stabilized earth (MSE) structures; liner support, voids bridging, reinforcement over soft hazardous pond closures and other environmental market applications.

**INSTALLATION GUIDELINES**

**Geosynthetic Placement**
Place the geosynthetic directly on prepared surface. It is advisable to leave vegetative cover such as grass and weeds in place to provide a support matting for construction activities. The geosynthetic should be deployed flat and tight with no wrinkles or folds. The rolls should be oriented as shown on plans to ensure the principal strength direction of the material is placed in the correct orientation. Adjacent rolls should be overlapped or seamed as a function of subgrade strength (CBR). Prior to fill placement, Mirafi® RSi-Series geosynthetics should be held in place using suitable means such as pins, soil, staples or sandbags to limit movement during fill placement.

**Fill Placement**
Fill should be placed directly over Mirafi® RSi geosynthetic in 8in (20cm) to 12in (30cm) loose lifts. For very weak subgrades, 18in (45cm) lifts or thicker lifts may be required to stabilize the subgrade, as directed by the engineer. Most rubber-tired vehicles can be driven at slow speeds, less than 10mph (16km/h) and in straight paths over the exposed geosynthetic without causing damage. Sudden braking and sharp turning should be avoided. Tracked construction equipment should not be operated directly upon the geosynthetic. A minimum fill soil thickness of 6in (15cm) is required prior to operation of tracked vehicles over the geosynthetic. Turning of tracked vehicles should be kept to a minimum to prevent tracks from displacing the fill and damaging the geotextile.

**These guidelines serve as a general basis for installation. Detailed instructions are available from your TenCate representative.**
